Lab 2

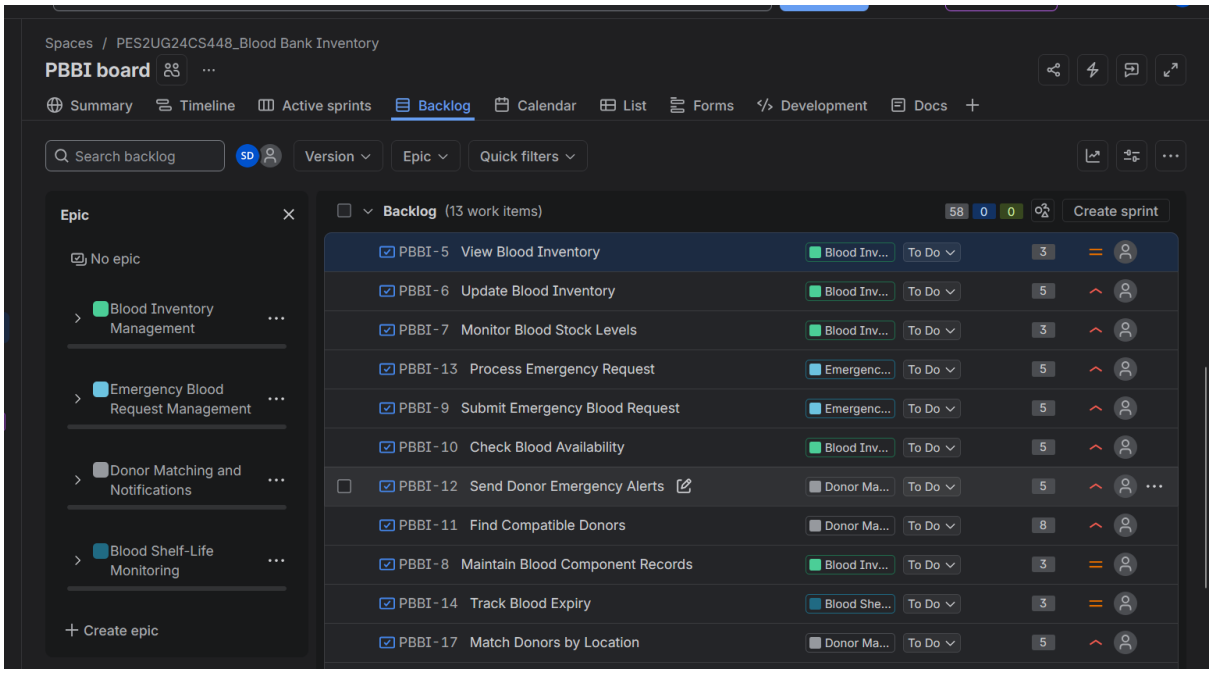

Topic: Blood Bank Inventory & Emergency Donor Matcher

Name: Satvik Das

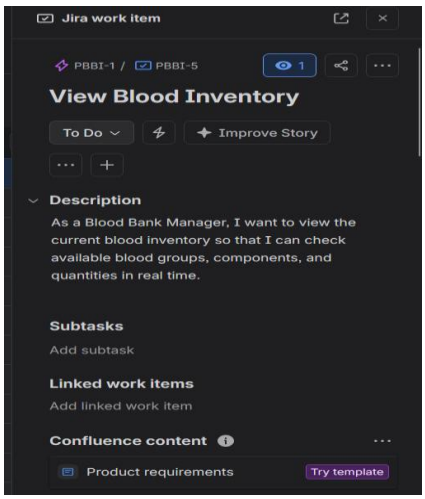

SRN: PES2UG24CS448

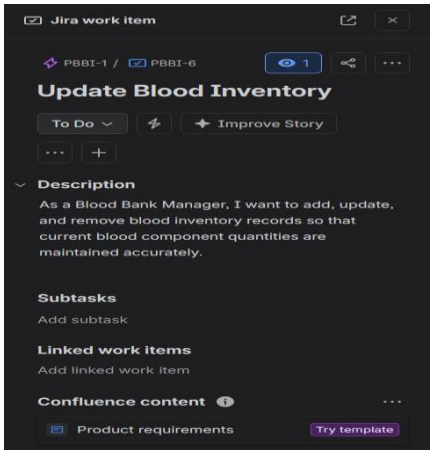

Part A: Required Screenshots

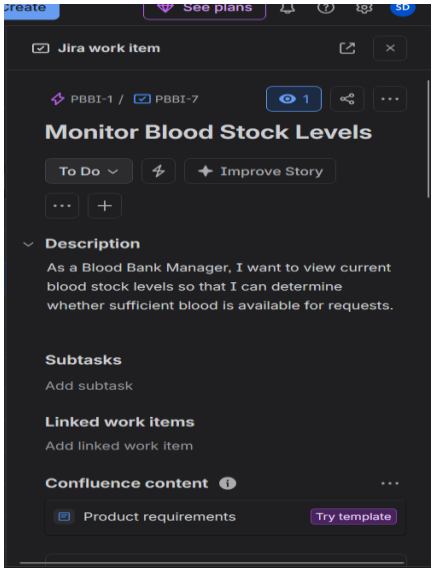

1. Jira Backlog with Epics and User Stories

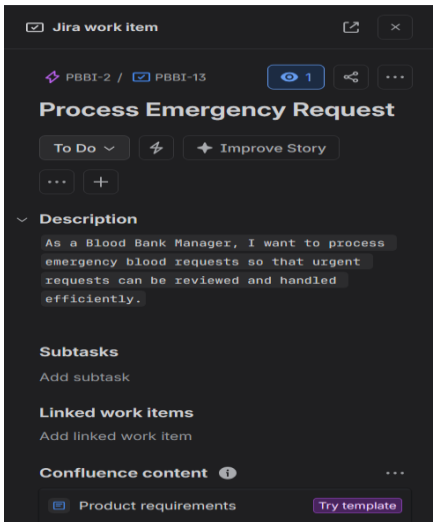

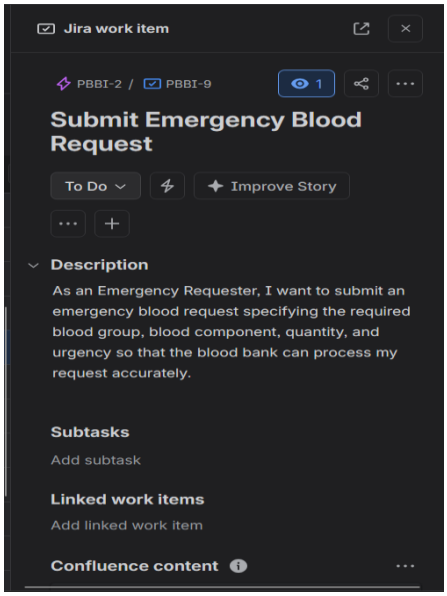

2.Story Point Assignments

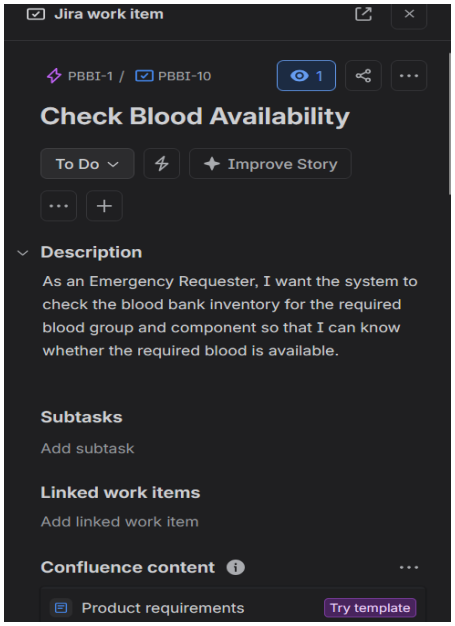

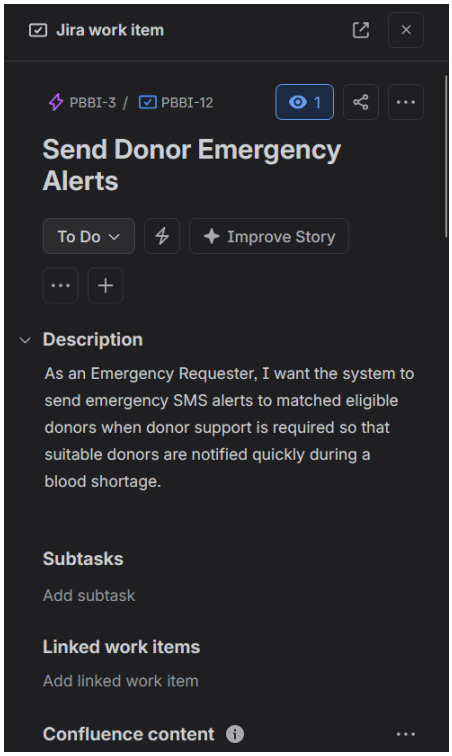

Jira work item
PBBI-1 / PBBI-6
1
Update Blood Inventory
To Do
Improve Story
Description
As a Blood Bank Manager, I want to add, update, and remove blood inventory records so that current blood component quantities are maintained accurately.

Jira work item
PBBI-1 / PBBI-7
1
Monitor Blood Stock Levels
To Do
Improve Story
Description
As a Blood Bank Manager, I want to view current blood stock levels so that I can determine whether sufficient blood is available for requests.

Jira work item
PBBI-2 / PBBI-13
1
Process Emergency Request
To Do
Improve Story
Description
As a Blood Bank Manager, I want to process emergency blood requests so that urgent requests can be reviewed and handled efficiently.

PBBI-2 / PBBI-9
1
Submit Emergency Blood Request
To Do
Improve Story
Description
As an Emergency Requester, I want to submit an emergency blood request specifying the required blood group, blood component, quantity, and urgency so that the blood bank can process my request accurately.

Jira work item
PBBI-1 / PBBI-10
1
Check Blood Availability
To Do
Improve Story
Description
As an Emergency Requester, I want the system to check the blood bank inventory for the required blood group and component so that I can know whether the required blood is available.

Jira work item
PBBI-3 / PBBI-12
1
Send Donor Emergency Alerts
To Do
Improve Story
Description
As an Emergency Requester, I want the system to send emergency SMS alerts to matched eligible donors when donor support is required so that suitable donors are notified quickly during a blood shortage.

Jira work item
PBBI-3 / PBBI-11
1
Find Compatible Donors
To Do
Improve Story
Description
As an Emergency Requester, I want the system to identify compatible eligible donors within a 10 km radius when the required blood component is unavailable or insufficient so that suitable donors can be contacted quickly.

3. Sprint Board (Active Sprint View)

Part B: Reflection Questions

1. Did your estimations reflect the actual effort?

Yes, the estimations were generally reasonable and reflected the expected effort required for the different user stories. Simpler stories such as **View Blood Inventory (3 points)** and **Monitor Blood Stock Levels (3 points)** required less effort compared to more complex stories such as **Find Compatible Donors (8 points)**. Stories involving emergency requests, donor matching, and inventory updates were assigned higher points because they involve more functionality and processing. Overall, the Fibonacci-based story points provided a reasonable indication of the complexity and effort involved in implementing the Blood Bank Inventory System.

2. Was your backlog well-prioritized?

Yes, the backlog was prioritized according to the importance of each feature to the Blood Bank Inventory System. High-priority stories such as **Update Blood Inventory (5 points)**, **Process Emergency Request (5 points)**, **Submit Emergency Blood Request (5 points)**, and **Find Compatible Donors (8 points)** focus on important operational and emergency functions. Other stories, such as **View Blood Inventory** and **Maintain Blood Component Records**, support the core inventory functionality. This prioritization ensures that the most important blood inventory and emergency-management features can be addressed first.

3. How did your simulated sprint align with your plan?

The simulated sprint broadly followed the planned structure. **Sprint 1 was configured for two weeks** and the user stories from the backlog were added to the sprint based on their priority and estimated story points. The sprint contained **13 user stories with a total estimate of 58 story points**, covering functionality from all four major areas of the Blood Bank Inventory System. The Jira Active Sprint board was used to organize the stories into **To Do, In Progress, and Done** stages. Overall, the sprint setup provided a clear representation of how the planned work could be managed during a development cycle.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart provided a visual representation of the planned workload and the remaining story points during the two-week sprint. The sprint started with a total of **58 story points**, and the guideline showed the expected reduction in work over the sprint period. This helped demonstrate how the team's progress could be tracked against the planned schedule. The chart also showed that the team had a significant amount of work planned for the sprint, indicating that **58 story points represented the team's planned sprint workload**. In a real project, the burndown chart would help identify delays or uneven progress early and allow the team to adjust its workload accordingly.
